Installation

Before demonstrating the continuous integration and delivery by building a Docker Jenkins Pipeline, is necessary to perform the installation of each program that need to use.

Because of that, is necessary to install Jenkins, Docker and Git.

Java Run Time

First important item about these processes, JRE is very important for all artifacts, because of this, this is the first step.

sudo apt-get update

```
Terminal - felandimgmail@ip-172-31-83-147: ~

Is possible to verify what is the installed version of Java with code `java -version`

```
felandimgmail@ip-172-31-83-147:~$ java -version
openjdk version "1.8.0_282"
OpenJDK Runtime Environment (build 1.8.0_282-8u282-b08-0ubuntu1~16.04-b08)
OpenJDK 64-Bit Server VM (build 25.282-b08, mixed mode)
felandimgmail@ip-172-31-83-147:~$
```

Jenkins Instalation

On the same terminal that executes the java installation, can be execute the Jenkins installation, with the command:

```
wget -q -O - https://jenkins-ci.org/debian/jenkins-ci.org.key | sudo apt-key add
```

if receives the message: *gpg: no valid OpenPGP data found.*

This problem might occur if you are behind corporate proxy and corporation uses its own certificate. Just add "--no-check-certificate" in the command. e.g. **wget --no-check-certificate -qO - http://pkg.jenkins-ci.org/debian/jenkins-ci.org.key | sudo apt-key add**

```
felandimgmail@ip-172-31-83-147:~$ wget -q -O - https://jenkins-ci.org/debian/jenkins-ci.org.key | sudo apt-key add
gpg: no valid OpenPGP data found.
felandimgmail@ip-172-31-83-147:~$ wget --no-check-certificate -qO - http://pkg.jenkins-ci.org/debian/jenkins-ci.org.key | sudo
apt-key add -
OK
```

And run the command **sudo sh -c 'echo deb http://pkg.jenkins-ci.org/debian binary/ > /etc/apt/sources.list.d/jenkins.list'** and after the command **sudo apt-get update**

```
felandimgmail@ip-172-31-83-147:~$ sudo sh -c 'echo deb http://pkg.jenkins-ci.org/debian binary/ > /etc/apt/sources.list.d/jenkins.list'

```

When Jenkins has installed, Jenkins generated an initial admin password, because of that is necessary to copy this password after access Jenkins local website.

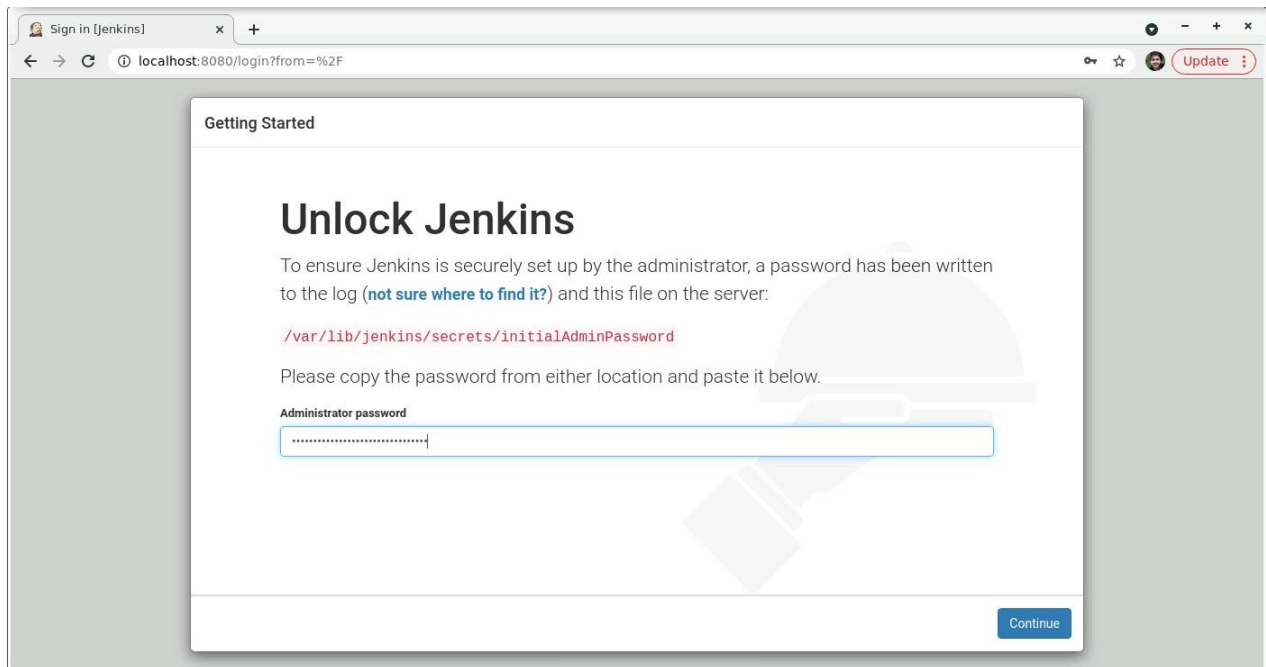

To verify Jenkins Initial admin password, is necessary to execute this command:

sudo cat /var/lib/jenkins/secrets/initialAdminPassword

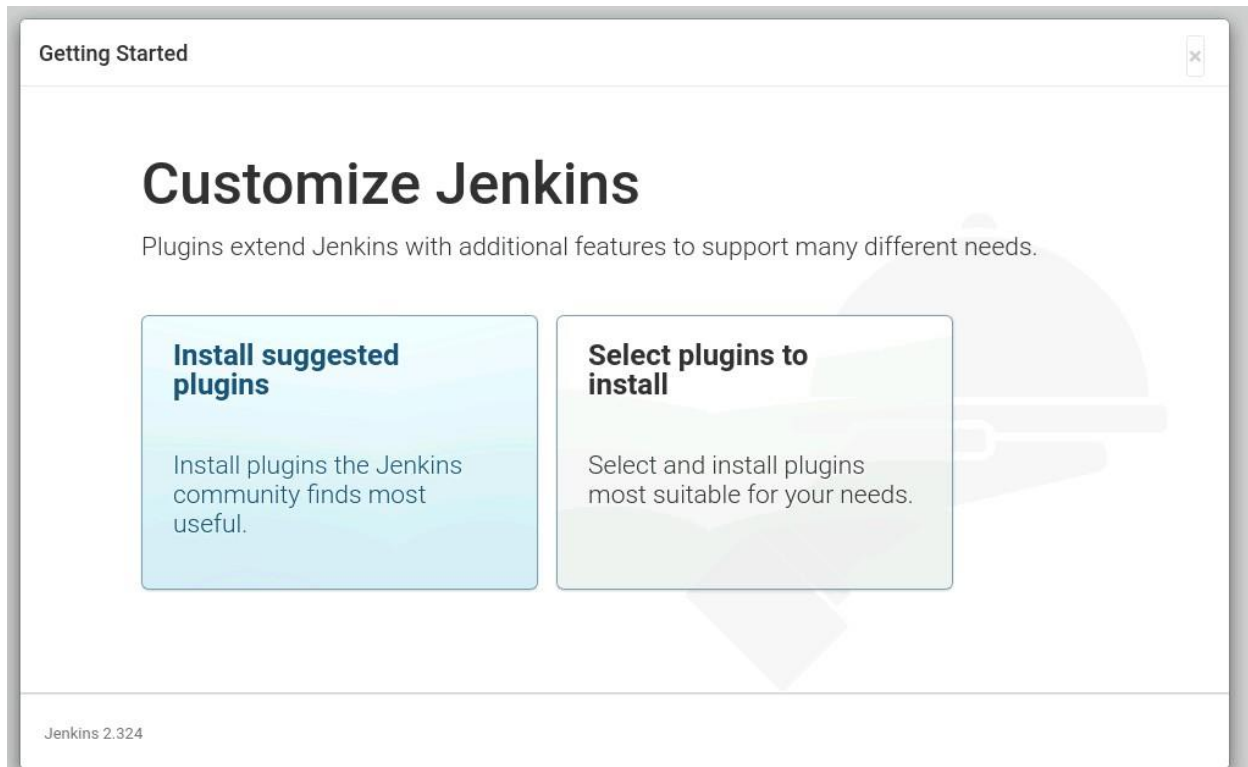

```
felandimgmail@ip-172-31-83-147:/$ sudo cat /var/lib/jenkins/secrets/initialAdminPassword
6efaed663dbe432aa282ed7970b17756
felandimgmail@ip-172-31-83-147:/$
```

And copy this initial password

Open a browser on a URL <http://localhost:8080> and on field Administrator password, paste the copied value.

Click on Install suggested plugins

To facilitate the currently process, we going to proceed with admin access

Is possible to change the Jenkins default URL, but at this moment we proceed with this url and port

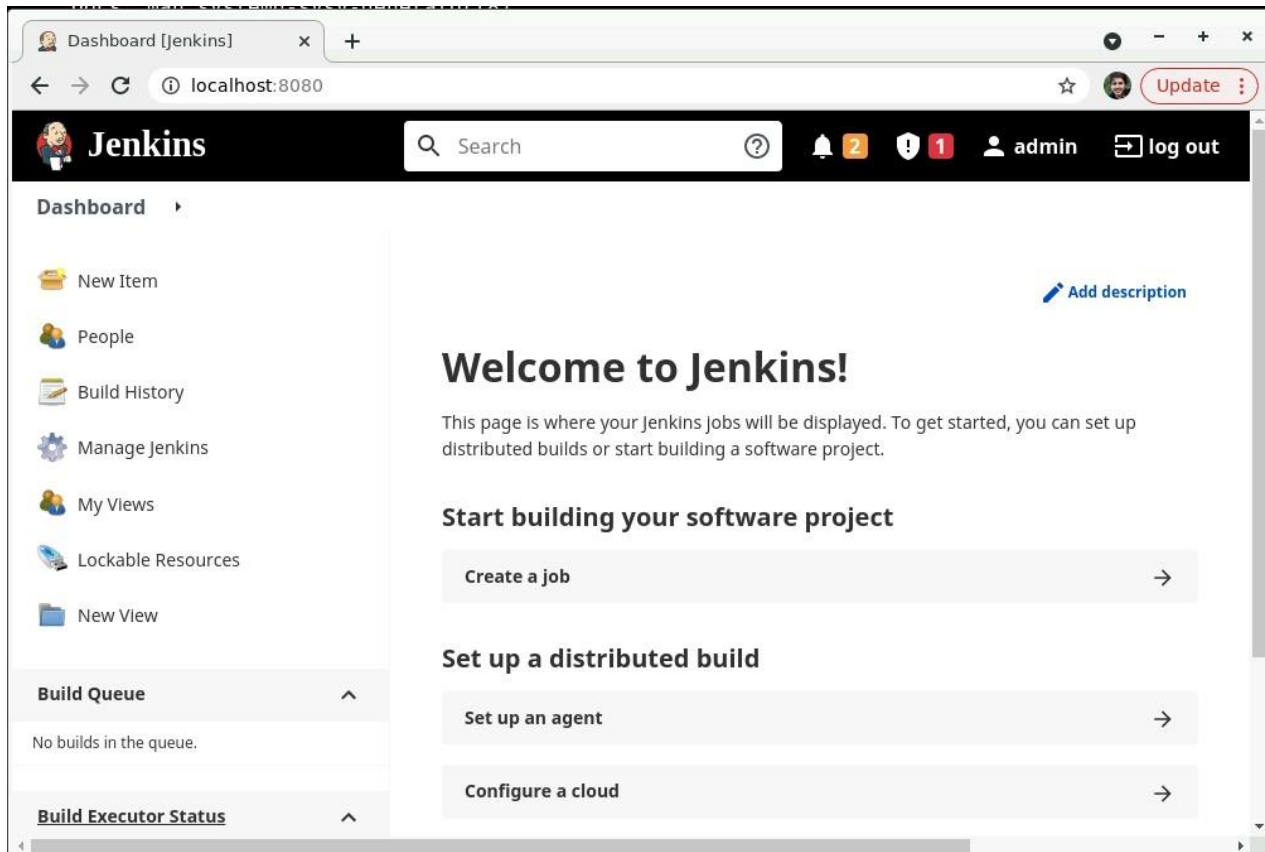

Instance Configuration

Jenkins URL:

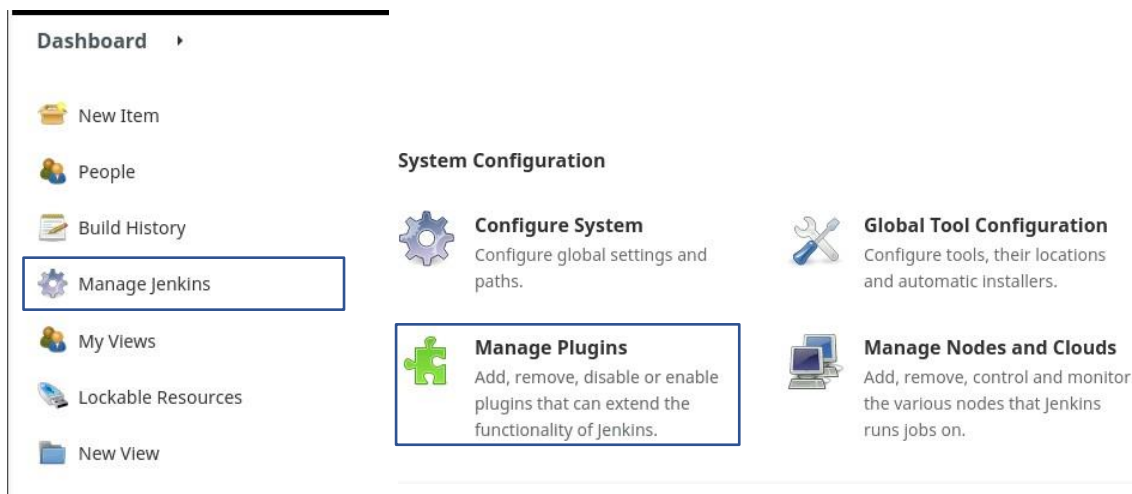

The Jenkins URL is used to provide the root URL for absolute links to various Jenkins resources. That means this value is required for proper operation of many Jenkins features including email notifications, PR status updates, and the `BUILD_URL` environment variable provided to build steps.

The proposed default value shown is **not saved yet** and is generated from the current request, if possible. The best practice is to set this value to the URL that users are expected to use. This will avoid confusion when sharing or viewing links.

The default installation has executed

With Suggested plugins has installed the github plugin, but we also proceed with docker plugin, but is necessary to install docker plugin to perform our solution, because of this is necessary to click on Manage Jenkins > Manage Plugins

Click on “**Available**” and Search for “**Docker**”, select Docker and Download *now and install after restart*

Test if docker is working running the default test repository from docker (hello-world)

```
File Edit View Terminal Tabs Help
felandimgmail@ip-172-31-83-147:/$ sudo docker run hello-world

Hello from Docker!
This message shows that your installation appears to be working correctly.

To generate this message, Docker took the following steps:
 1. The Docker client contacted the Docker daemon.
 2. The Docker daemon pulled the "hello-world" image from the Docker Hub.
    (amd64)
 3. The Docker daemon created a new container from that image which runs the
    executable that produces the output you are currently reading.
 4. The Docker daemon streamed that output to the Docker client, which sent it
    to your terminal.

To try something more ambitious, you can run an Ubuntu container with:
$ docker run -it ubuntu bash

Share images, automate workflows, and more with a free Docker ID:
https://hub.docker.com/

For more examples and ideas, visit:
https://docs.docker.com/get-started/

felandimgmail@ip-172-31-83-147:/$
```

Git Instalation

First is necessary to check if has the git is installed, if is not installed, doesn't have a problem, these following steps is also responsible install the git.

```
File Edit View Terminal Tabs Help
felandimgmail@ip-172-31-83-147:/$ git --version
bash: git: command not found
```

Case is installed, is only necessary execute these following commands:

sudo apt-get update

```

GitHub Repository

Create a new Jenkins repository on GitHub WebSite

Create a new repository

A repository contains all project files, including the revision history. Already have a project repository elsewhere?
[Import a repository.](#)

Owner * / Repository name *

Great repository names are Need inspiration? How about [bookish-octo-chainsaw](#)?

Description (optional)

☒ **Public**
Anyone on the Internet can see this repository. You choose who can commit.

☐ **Private**
You choose who can see and commit to this repository.

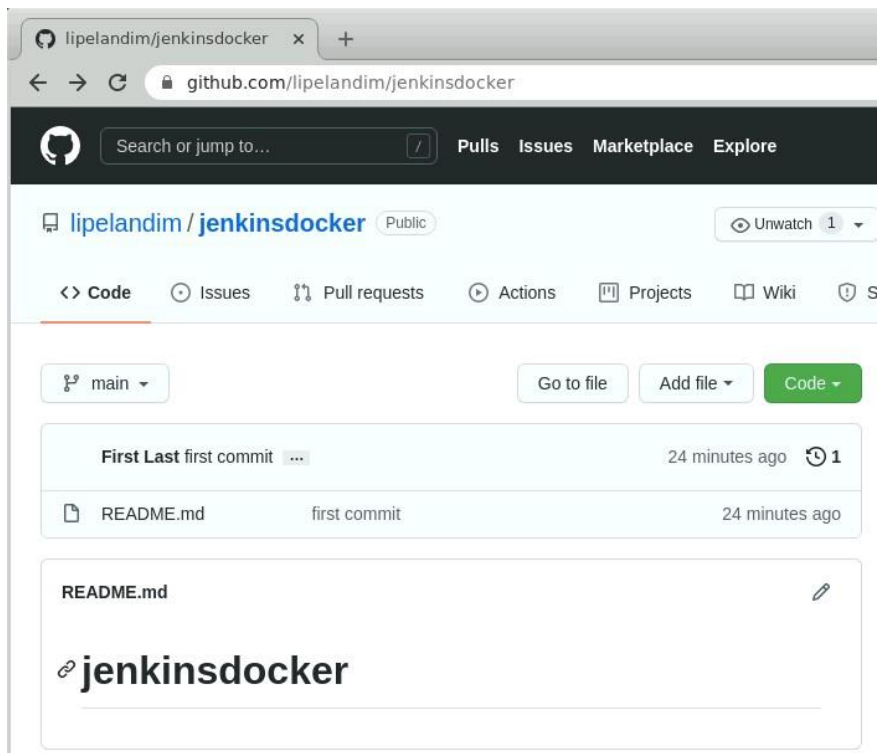

Create a directory named Jenkinsdocker

```
felandimgmail@ip-172-31-83-147:~$ mkdir jenkinsdocker
felandimgmail@ip-172-31-83-147:~$ cd jenkinsdocker
felandimgmail@ip-172-31-83-147:~/jenkinsdocker$ ls
felandimgmail@ip-172-31-83-147:~/jenkinsdocker$
```

Execute these following commands

```
echo "# jenkinsdocker" >> README.md
git init
git add README.md
git commit -m "first commit"
git branch -M main
git remote add origin git@github.com:lipelandim/jenkinsdocker.git
git push -u origin main
```

The github repo is working

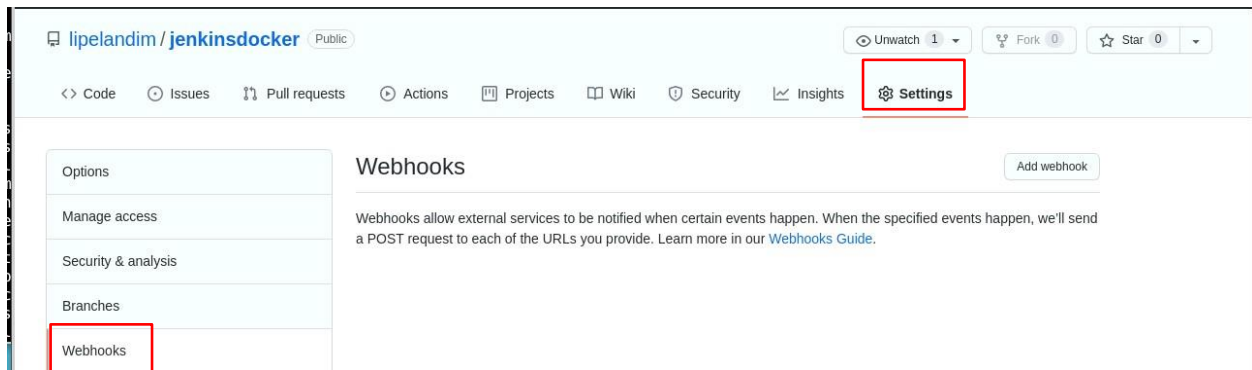

GitHub webhook

To configure the integration with GitHub.

Create a webhook inside the fork you created:

- Select **Settings**, then select **Webhooks** on the left-hand side.

- Choose **Add webhook**, then enter *Jenkins* in filter box.
- For the **Payload URL**, enter `http://<publicIp>:8080/github-webhook/`. Make sure you include the trailing `/`
- For **Content type**, select *application/x-www-form-urlencoded*.
- For **Which events would you like to trigger this webhook?**, select *Just the push event*.
- Set **Active** to checked.
- Click **Add webhook**.

The screenshot shows the GitHub webhooks configuration interface. On the left is a sidebar with navigation links: Webhooks, Notifications, Integrations, Deploy keys, Actions, Environments, Secrets, Pages, and Moderation settings. The main content area is titled 'Webhooks' and includes a brief explanation of webhooks. The configuration fields are as follows:

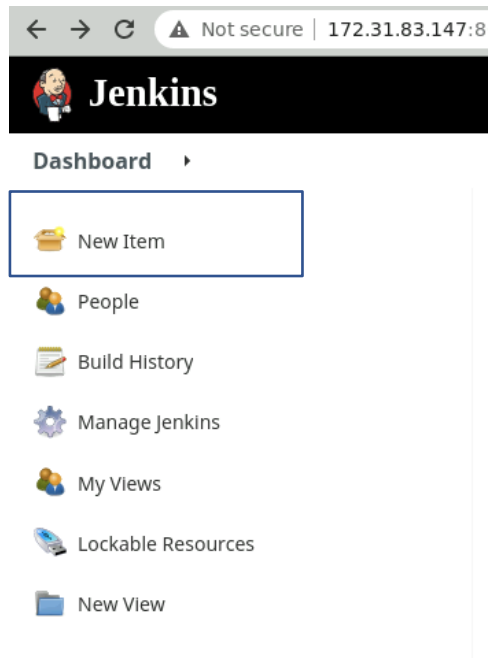

- Payload URL ***: A text input field containing the URL `http://172.31.83.147:8080/github-webhook/`.
- Content type**: A dropdown menu set to `application/json`.
- Secret**: An empty text input field for a secret key.
- Which events would you like to trigger this webhook?**: Three radio button options:
 - ☒ Just the push event.
 - ☐ Send me **everything**.
 - ☐ Let me select individual events.
- Active**: A checked checkbox with the text 'We will deliver event details when this hook is triggered.'

At the bottom, there are two buttons: a green 'Update webhook' button and a light red 'Delete webhook' button.

Integrating Jenkins and GitHub

To have Jenkins respond to an event in GitHub such as committing code, create a Jenkins job.

On Jenkins portal click on New Item

Select FreeStyle Project and put a name for your project >> Ok

Enter an item name

» Required field

**Freestyle project**

This is the central feature of Jenkins. Jenkins will build your project, combining any SCM with any build system, and this can be even used for something other than software build.

**Pipeline**

Orchestrates long-running activities that can span multiple build agents. Suitable for building pipelines (formerly known as workflows) and/or organizing complex activities that do not easily fit in free-style job type.

**Multi-configuration project**

Suitable for projects that need a large number of different configurations, such as testing on multiple environments, platform-specific builds, etc.

Enter

OK

container that stores nested items in it. Useful for grouping things together. Unlike view, which is just a filter, a folder creates a separate namespace, so you can have multiple things of the same name as long as they are in different folders.

On Source Code Management put the Repository URL

The screenshot shows the 'Source Code Management' tab in the Jenkins configuration interface. The 'Git' radio button is selected. Under the 'Repositories' section, the 'Repository URL' field contains 'https://github.com/lipelandim/jenkinsdocker'. The 'Credentials' dropdown is set to '- none -' with an 'Add' button next to it. There are 'Advanced...' and 'Add Repository' buttons at the bottom right of the configuration area.

On Build Trigger select Poll SCM and type * * * * *

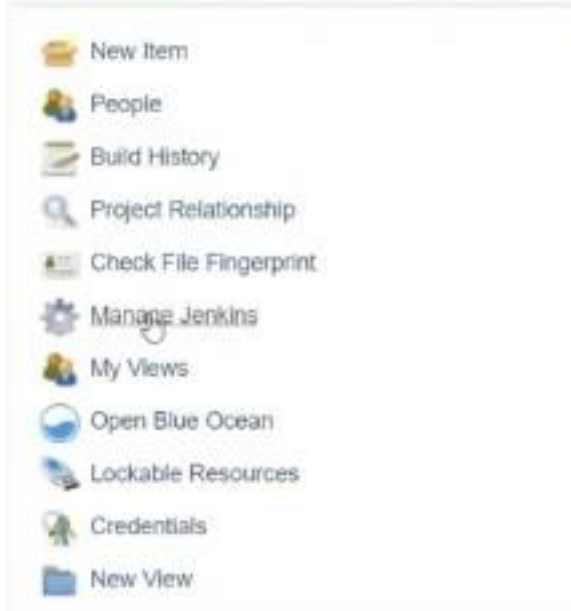

The screenshot shows the 'Build Triggers' section of the Jenkins configuration. The 'Poll SCM' checkbox is checked. The 'Schedule' field contains '* * * * *'. A yellow warning message is displayed: '⚠ Do you really mean "every minute" when you say "* * * * *"? Perhaps you meant "H * * * *"' to poll once per hour'. Below the warning, it states: 'Would last have run at Saturday, December 11, 2021 10:07:06 PM UTC; would next run at Saturday, December 11, 2021 10:07:06 PM UTC.' The 'Ignore post-commit hooks' checkbox is unchecked.

And Save changes.

If you change your code on github the process will starts automatically on Jenkins, the CI process is working fine.

Now is necessary to install Docker Plugin

Click on Manage Jenkins

Click on Manage Plugins

Install these plugins

<input checked="" type="checkbox"/>	CloudBees Docker Build and Publish Build Tools docker This plugin enables building Dockerfile based projects, as well as publishing of the built images/repos to the docker registry. 1.3.3 9 mo 22 days ago
<input checked="" type="checkbox"/>	Docker plugin This plugin integrates Jenkins with Docker 1.2.5 <button>Uninstall</button>
<input checked="" type="checkbox"/>	docker-build-step Build Tools docker This plugin allows to add various docker commands to your job as build steps. 2.8 5 mo 16 days ago

Click on Project

ALL

+

Add description

S	W	NAME	LAST SUCCESS	LAST FAILURE	LAST DURATION
		jenkinsdocker	9 min 12 sec #9	28 min #6	0.22 sec

Pro tip
You can push a new image to this repository using the CLI

```
docker tag local-image:tagname new-repo:tagname
docker push new-repo:tagname
```

Make sure to change *tagname* with your desired image repository tag.

Create docker login

```
felandimgmail@ip-172-31-83-147:~/jenkinsdocker$ docker login
Login with your Docker ID to push and pull images from Docker Hub. If you don't
have a Docker ID, head over to https://hub.docker.com to create one.
